

Ceiling Lattice – Ellipse Assembly & Installation Instructions

Hanging acoustic solutions add a design element to any space. The Ceiling Lattice design controls echo, and creates a stylish feature.

Designed using sound absorbing PET acoustic material, these acoustic solutions reduce noise and absorb sound.

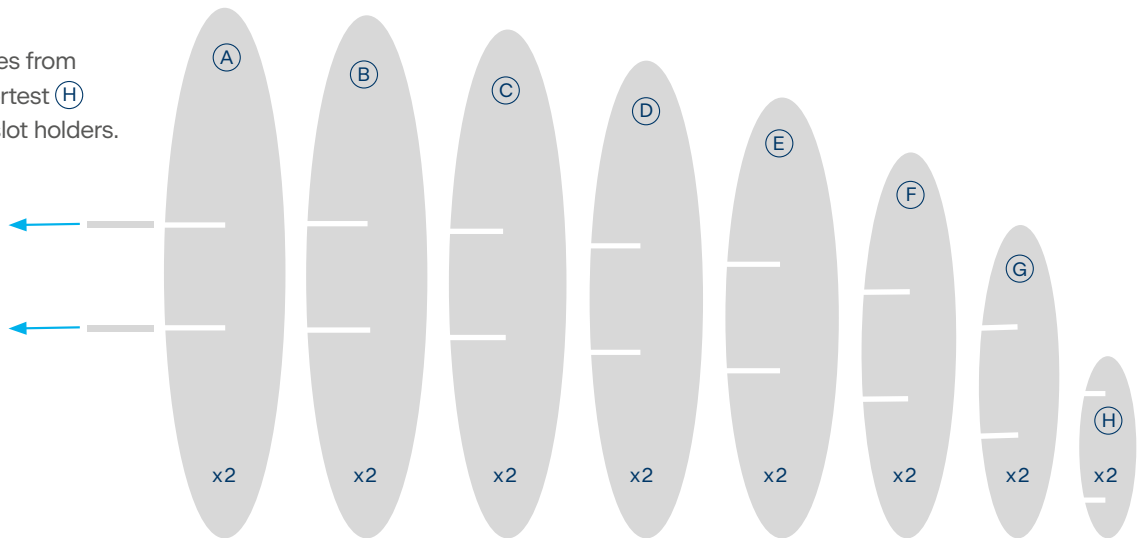

Ceiling Lattice – Ellipse Assembly Instructions

1. Pop the components out of the acoustic panel and sort into pairs.

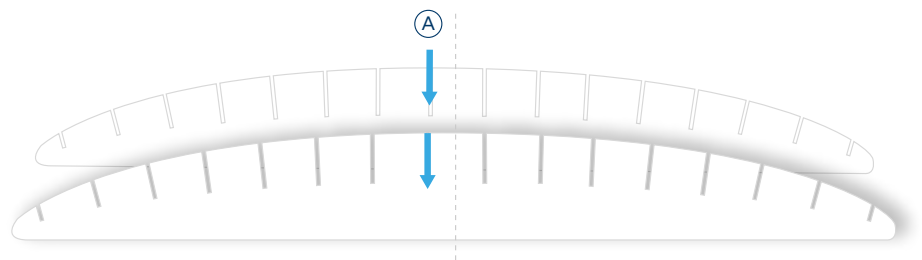

2. Lay out the ellipses from longest (A) to shortest (H) and remove the slot holders.

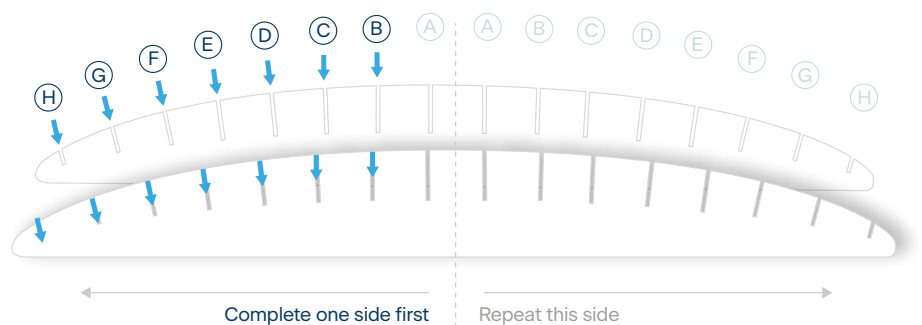

3. Take the longest pieces (central panels) and lay them out side by side. Remove the slot holders.

4. Take the longest ellipse (A). Count in 8 slots from each end of the central panels and insert the longest ellipse (A) into both panels.

5. Continue to insert the ellipses from longest to shortest, moving out from the middle to the end of the central panels.

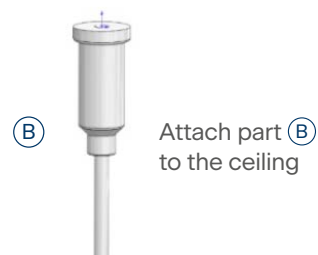

6. Repeat on the other side until complete.

Ceiling Lattice – Ellipse Installation Instructions

Your Ceiling Lattice – Ellipse includes an HPHANG Hanging Kit. Attach parts as shown below.

To install on the ceiling:

1. Count in from the outside of the central panels to the 5th ellipse.
2. Drill a small hole in the long central panel to allow the grub screw to screw through the panel. Repeat on the other end of the central panel. Repeat on the second central panel so you have all four fixings in place. Insert the wire into (A).

3. Measure the distance between each of the fixings (A) and screw the ceiling mounts (B) into the ceiling at the same dimensions. Ensure the fixing is adequate to hold the weight of the lattice, using wall plugs if required.

4. Using two people lift the lattice and feed the wire through (B) and out through the gap in the side of the ceiling mount.

5. Pull the wire through to the approximate length you need and adjust the length of the wires to ensure the lattice sits level. Cut the wire to length.

Option to fix Ceiling Lattice to ceiling tiles:

If you have ordered CEILINGGFIX Ceiling Grid Fixing Kit simply twist the white fixings on to the ceiling grid and screw the mount on. Now feed the wire through the ceiling mount, to the approximate length you need and adjust the length of the wires to ensure the panel sits level. Cut the wire to length.
